

Client iMessages as a clean, *Bates-numbered* PDF.

A Mac app your client runs on their own computer. It reads the local Messages database and produces a paginated record with a timestamp on every message, a SHA-256 source hash, and an optional declaration. No screenshot binders, and no client data sent to a vendor.

What comes back

- **Cover page:** participants with their actual numbers or emails, date range, message count, Bates range, source path, SHA-256 hash, and import and export times.
- **Declaration** (optional): pre-filled with the hash and range. US § 1746, Canadian statutory declaration, UK statement of truth, or generic.
- **Transcript:** date, time, and sender on every message; photos inline; reactions, edits, and unsent messages marked.
- **Bates:** your prefix and starting number, on every page.

How it fits

- **Client runs it:** send them the guide link, the date range, and your Bates prefix. They send back the PDF.
- **Office runs it:** import a `chat.db` copied from the client's Mac.

Integrity

- The source database is copied, never modified, and opened read-only.
- The snapshot is hashed on import and kept on the Mac, so it can be re-verified with `shasum -a 256`.
- Signed with an Apple Developer ID and notarized.

Privacy

- Messages are read, indexed, and exported on the Mac. Nothing is uploaded.
- Network use is limited to a license-key check and an update check.

Licensing

Pay what you want

- Free to download, browse, and search. A license unlocks export.
- One-time price, \$0 and up. Clients who can't pay take the \$0 tier.
- Up to 3 Macs per license, at any price. Multi-seat on request.
- 14-day refunds, no questions asked.
